EP 0 765 673 A2

Description

This invention relates to an apparatus and method for the treatment of tumors. More particularly, the invention relates to an apparatus for the irradiation of shallow tumors with pulsed electromagnetic radiation.

Several non-surgical methods are available for treatment of cancer, but all of them have disadvantages. Chemical therapy and photodynamic therapy are accompanied by the introduction of a toxic agent into the body. Electromagnetic radiation therapy using X-rays causes the destruction of healthy tissue due to X-rays ability to penetrate deeply into human tissue.

Another method, called hyperthermia, is used for tumor necrosis both by itself, and in combination with other methods of cancer treatment. The basic purpose of hyperthermia is to raise tumor temperature substantially above body normal temperature, to a temperature at which tumor cells are killed. The selectivity of hyperthermic therapeutic methods are the extent to which the tumors and not the surrounding healthy tissue is destroyed. Hyperthermic treatments have been employed for both whole body heating and for local heating of tumors. Local hyperthermia typically uses sources of electromagnetic radiation, focused on the tumor at frequencies that will heat tumor tissue and not the surrounding healthy tissue. Microwave, visible and infrared frequency ranges are commonly employed for this purpose.

Current hyperthermic methods have significant disadvantages. Treatment times are often long, on the order of an hour. Furthermore, the selectivity of the radiation is low, causing necrosis not only of tumor tissue, but of the healthy surrounding tissue as well.

Hyperthermia treatments using microwave radiation sources (typically radiating at about 915 MHz) have the disadvantage of deep non-tunable penetration (several centimeters) into the body as well as problems with focusing which cause low selectivity.

Nd:YAG laser radiation sources are used both by themselves and in combination with photodynamic therapy. One disadvantage of Nd:YAG laser when used for hyperthermia is its small spot size, on the order of 5 mm. A radiation source this small cannot easily heat large tumors, which may have a projected area of several square centimeters on the skin, resulting in extended treatment times. In addition, the Nd:YAG laser has other limitations relating to their continuous wave (CW) operating mode, and with their limited tunable range. It is clear that an improved apparatus and method for hyperthermia tumor treatment is desirable.

Pulsed radiation of a tumor using a light source would cause more efficient hyperthermia and necrosis than current methods provide. Furthermore, a radiation source capable of heating tissue in a short time interval, preferably between 41 and 45 degrees C, would reduce the treatment times currently required. Providing a radiation source with a broad controllable spectrum of radiation in the visible and near infrared regions would allow

the penetration depth and the selectivity of the treatment to be more accurately controlled.

The present invention is directed to a method for the hyperthermic treatment of tumors with electromagnetic radiation including the steps of providing a pulsed radiation output from a radiation source and directing said pulsed radiation output toward a tumor. The radiation may be developed over at least one continuous band of wavelengths, or be generated in the visible and near-infrared band, possibly in a continuous band between 600 and 1000 nm. In one embodiment, it may include the step of transmitting a broad radiation beam to a pigmented tumor, which might have a cross-sectional area of between 0.8 cm² and 500 cm². In another embodiment, it is possible to control the pulse-width of the pulsed radiation output, focus the radiation source for controlling the power density of the pulsed radiation output, or filter and control the spectrum of the pulsed radiation output. In particular, one may focus the pulsed radiation output to a beam having a cross-sectional area of greater than 0.8 cm². **Alternatively, one may cut off the UV portion of the spectrum. A pulse width in the range of about 100 microseconds to 50 milliseconds may be provided, particularly, one having an energy density at the treatment area of at least 0.2 W/cm². Alternatively, energy densities of greater than 90 J/cm², 120 J/cm² per treatment may be provided at the treatment site. A pulse delay of greater than 100 milliseconds or less than 100 seconds may also be provided.**

In another embodiment of the invention, an apparatus for the treatment of tumors is provided, including a radiation source producing pulsed radiation at least in the visible and near-infrared wavelengths, a delivery system near the radiation source for focusing and directing the radiation to a treatment site, and a filtering system restricting the radiation to visible and near-infrared wavelengths. Alternatively, the radiation source may produce pulsed radiation in a broad band, or over at least one continuous range of wavelengths. This may be focused in a beam of at least 0.8 in². The radiation may be restricted to a band between 300 and 1000 nm, or may be UV blocked by a filter. The radiation pulses may have a duration of between 100 μsecs and 100 msec, and may be spaced from 100 msec to 100 secs apart. In addition, they may be delivered to the treatment area with a radiation density of greater than 0.2 W/cm², 90 J/cm², or 120 J/cm². The radiation may also be limited to a radiation density of less than 200 J/cm².

Other principal features and advantages of the invention will become apparent to those skilled in the art upon review of the following drawings, the detailed description and the appended claims.

The present invention will now be described, by way of example only, with reference to the accompanying drawings, in which:-

FIGURE 1 is a graph of radiation tissue penetration versus radiation wavelength;

FIGURE 2! Is! a! cross-sectional! view! of! tumor! treatment! **device**! according! to! the! **present! invention**;! and! **FIGURE! 3!** Is! a! graph! of! treatment! results! using! the! **FIGURE! 2!** tumor! treatment! device.

Before! explaining! at! least! one! **embodiment**! of! the! invention! in! detail! it! is! to! be! understood! that! the! invention! is! not! limited! in! its! application! to! the! details! of! construction! and! the! arrangement! of! the! components! set! forth! In! the! following! description! or! illustrated! in! the! drawings. The! invention! is! capable! of! other! **embodiments**! or! being! practiced! or! carried! out! in! various! ways.! Also,! it! is! to! be! understood! that! the! **phraseology**! and! **terminology**! employed! **herein! is! for! the! purpose! of! description!** and! should! not! be! regarded! as! limiting.

The! present! invention! is! directed! to! a! method! and! apparatus! for! treating! shallow! tumors! using! pulsed! radiation.! Treatment! of! such! tumors! is! problematic,! since! the! outer! layers! of! skin! must! be! **penetrated**! and! not! harmed,! yet! the! radiation! must! get! to! the! underlying! tumorous! growth! sufficient! to! heat! the! tumor! and! cause! necrosis.! The! effective! penetration! depth! d ,! of! radiation! is! a! measure! of! the! radiation's! ability! to! **penetrate**! the! skin! and! affect! an! underlying! tumor.! It! is! defined! herein! as! the! depth! below! the! surface! of! the! skin! at! which! the! radiation! fluence! reaches! 1/e! times! the! magnitude! of! the! radiation! nuance! on! the! surface! of! the! skin. Since! the! effective! penetration! depth! varies! with! the! wavelength! of! the! impinging! radiation,! tumors! at! a! particular! depth! can! be! targeted,! and! the! overlying! skin! preserved,! by! selecting! and! applying! particular! wavelengths! of! radiation! for! tumors! at! a! particular! depth.

The! effective! penetration! depth! can! be! estimated! by! using! the! effective! attenuation! coefficient, μ_{eff} ,! of! the! dermis,! which! takes! into! account! the! scattering! and! absorption! of! light! in! tissue.! The! relation! of! the! effective! penetration! depth! to! the! effective! attenuation! coefficient! can! be! estimated! as:

$$d = 1/\mu_{\text{eff}}$$

Following! Jacques! (S.L.! Jacques,! Role! of! Skin! Optics! in! Diagnostic! and! Therapeutic! Uses! of! Lasers,! Lasers! and! Dermatology',! Springer-Verlag,! 1991,! pp. 1-21),! the! effective! attenuation! coefficient! of! the! dermis! can! be! expressed! as! follows:

$$\mu_{\text{eff}} = (3/4)^{1/2} (\mu_a + \mu_s g)$$

where

- μ_{eff} = attenuation! coefficient! of! dermis
- μ_a = absorption! coefficient! of! dermis
- μ_s = scattering! coefficient! of! dermis,! and
- g = the! anisotropy! factor,! defined! as! the! average! cosine! of! the! scattering! angle! for! one! scatter-

ing! event.

Using! the! above! coefficients! and! factor,! a! chart! has! been! made! of! the! effective! penetration! depth! in! centimeters! versus! the! wavelength! of! electromagnetic! radiation! impinging! upon! the! skin.! This! chart! is! illustrated! In! **FIGURE! 1!** As! **FIGURE! 1!** discloses,! the! effective! penetration! depth! increases! with! increasing! wavelength,! and! for! wavelengths! between! 400! nm! and! 1000! nm! varies! between! 0.03! cm! and! 0.25! cm.! Radiation! can! **penetrate**! as! deeply! as! 2! mm! with! a! radiation! wavelength! of! 800! nm.! The! sensitivity! of! effective! penetration! depth! to! wavelength! is! clear! from! this! chart.! For! example,! d ! doubles! when! the! wavelength! of! the! impinging! radiation! increases! by! a! mere! 20% (**500! to! 600** nm). **Because! varying!** the! applied! radiation! wavelength! varies! the! depth! of! penetration! of! that! radiation,! one! can! control! treatment! depth! by! controlling! the! radiation! wavelength.

Hyperthermic! treatments! also! **depend**! upon! the! length! of! time! radiation! is! applied! to! the! surface! of! the! skin.! The! effective! depth! of! tissue! heating! based! on! heat! conducted! from! the! surface! depends! upon! the! conductivity! of! the! skin.! The! time! t ,! **required! for! a! heat! wave! to** **penetrate!** to! a! depth! d ,! **below! the! surface**! of! the! skin! can! be! expressed! as:

$$t = d^2/a,$$

where:

$$a = \text{the! diffusivity! of! the! skin! (approximately } 3 \times 10^{-7} \text{ m}^2 \text{sec}^{-1} \text{)}.$$

Thus,! the! depth! of! penetration! can! be! controlled! by! controlling! the! time! interval! over! which! radiation! is! applied! to! the! surface! of! the! skin.! For! example,! conducting! heat! from! the! surface! of! a! skin! throughout! a! shallow! tumor! with! a! thickness! of! about! 1! cm! requires! about! a! 5! minute! application! of! radiation! to! the! surface! of! the! skin.

These! two! modes! of! heating! conduction! from! the! surface! of! the! skin,! and! radiant! penetration,! can! be! tailored! to! specific! tumors! by! varying! the! wavelength! and! the! pulse! duration.

A! major! limitation! to! the! use! of! radiation! sources! for! therapeutic! treatment! is! the! potential! tissue! damage.! In! order! to! radiate! the! tumor! with! the! optimum! wavelengths! of! radiation! yet! not! burn! tissue,! a! radiation! source! is! preferably! pulsed,! thereby! providing! radiation! at! wavelengths! sufficient! to! penetrate! the! tumor! to! an! optimum! depth,! yet! limiting! the! average! energy! density! during! a! treatment! and! preventing! the! upper! layers! of! the! tumor! from! being! **overheated**.

To! provide! for! the! treatment! of! a! wide! range! of! shallow! tumors,! the! **preferred! energy**! density! **per pulse!** is! **between** 0.1! and! 10! Joules! **per! square** centimeter! of! tumor! area.! These! pulses! are! **preferably! repeated** at! a! rate! of! between! 0.1! and! 1! Hertz.! The! number! of! pulses! for

treating! shallow! tumors! preferably! ranges! between! 1 and! 1000! pulses.! To! treat! a! wide! range! of! tumor! sizes, the! radiation! should! be! applied! to! an! area! of! the! skin ranging! from! $0.8! \text{cm}^2$ to! $500! \text{cm}^2$.

It! is! clear! from! FIGURE! 1! that! by! irradiating! a! tumor with! selected! bands! of! radiation! in! the! visible! and! near Infrared! regions,! the! tumor! can! **be! penetrated** to! a! depth of! between! 0.05! and! 0.25! cm! and! **hyperthermally** treated.! FIGURE! 2! illustrates! just! such! a! tumor! treatment! apparatus! 10,! having! a! housing! 12! that! encloses! a! radiation! source! 14,! and! a! reflector! 16,! and! having! an! opening! with! a! set! of! optical! filters! 18, 20,! and! a! **delivery** system! 22. A **processor! 24** is **provided! to** control! radiation source! 14! through! lamp! driver! circuit! 26,! under! the! control! of! a! program! in! memory! 28.

Radiation! source! 14! is! a! flashlamp! such! as! a! gas filled! linear! flashlamp! Model! No.! L5568! available! from ILC.! Typically,! a! flashlamp's! energy! is! emitted! as! broad-band! incoherent! energy! in! the! 300! to! 1000! nm! wavelength! range,! which,! as! FIGURE! 1! shows,! is! well-suited to! penetrating! tissue! to! a! depth! of! several! millimeters, and! thus,! for! treating! shallow! tumors.

To! treat! a! tumor,! the! radiation! must! **be! focused! and** delivered! to! the! treatment! site,! and! thus! reflector! 16! and delivery! system! 22! are! provided.! Reflector! 16! gathers the! radiation! and! directs! it! toward! an! opening! in! the housing.! To! effectively! reflect! radiation! in! the! 300! to 1000! nm! band,! reflector! 16! is! preferably! metallic,! typically! aluminum! which! is! easily! machinable! and! polishable,! and! has! a! very! high! reflectivity! in! the! visible! and near! infrared! ranges! of! the! spectrum.! Other! bare! or coated! metals! can! also! be! used! for! this! purpose.

Optical! filters! 18! and! neutral! density! filters! 20! are mounted! in! housing! 12! and! may! be! moved! into! the! beam or! out! of! the! beam! to! control! the! spectrum! and! intensity of! the! light.! The! optical! filters! may! include! bandwidth! and low! cutoff! filters! in! the! visible! and! infrared! portions! of! the spectrum.! To! limit! skin! damage,! it! is! desirable! to! employ UV! filters! to! block! the! UV! portion! of! the! spectrum,! in! particular, UV! filters! that! cut! off! the! spectral! range! below 510! nm.! For! deeper! penetration! it! is! preferable! to! use narrower! bandwidth! filters.! Optical! bandwidth! filters! and the! cutoff! filters! are! readily! available! commercially.! Neutral! density! filters! with! varying! degrees! of! filtration! can be! used! to! reduce! the! total! fluence! transmitted! to! the skin! by! blocking! the! transmission! of! radiation! emitted! by the! radiation! source! to! the! treatment! site.

The! radiation! is! delivered! to! the! treatment! site! by delivery! system! 22,! typically! an! optical! fiber! or! a! quartz light! guide,! although! it! may! be! preferable! to! emit! light directly! from! an! opening! in! the! housing.! The! delivery system! should! produce! fluences! on! the! skin! of! between $100! \text{mJ/cm}^2$ to! $10! \text{J/cm}^2$.

Radiation! source! 14! is! pulsed! to! provide! control! of the! total! fluence,! and! thus! control! of! tumor! and! skin! heating.! To! vary! the! fluence,! the! delay! interval! between! pulses! may! be! increased! or! decreased, **preferably** over! a range! of! a! hundred! milliseconds! to! tens! of! seconds.! In

this! manner,! the! tumor! can! be! heated! at! a! rate! sufficient to! allow! skin! penetration! and! tumor! necrosis,! yet! not overheat! tissue.! Total! fluence! can! also! be! controlled! by varying! the! duration! of! each! pulse! over! a! range! of! between! a! hundred! microseconds! and! tens! of! milliseconds,! to! vary! the! fluence! per! pulse! from! a! hundred millijoules! to! tens! of! joules! using! a! flashtube.! Total! fluence can! also! be! modified! by! varying! the! energy! per! pulse.

Effective! penetration! depth! is! dependent! on! the wavelength! of! radiation! received! at! the! surface! of! the skin.! The **present! invention! provides** for! changes! in wavelength! in! several! ways.! Filter! 18! can! be! a! low-pass or! band-pass! filter,! thereby! blocking! selected! wavelengths! of! light.! Varying! the! power! per! pulse! will! also vary! the! emission! spectrum! of! the! radiation! source! as well.

Processor! 24! is! provided! to! control! the! energy! per pulse,! the! pulse! repetition! rate,! pulse! duration! rate! and the! number! of! pulses! per! a! single! treatment.! It! is! connected! to! radiation! source! 14! through! a! lamp! driver! circuit! 26,! which! is! capable! of! generating! power! sufficient to! trigger! radiation! source! 14.! Processor! 24 **operates** under! the! control! of! a! program **stored** in **memory! circuit** 28.

The! present! invention is! well! suited! to! treating! tumors! with! a! wide! variety! of! sizes.! For! smaller! tumors,! a fiber! optic! delivery! system! is **appropriate**. By! directing the! radiation! through! a! fiber! to! the! treatment! site,! small tumors! typically! on! the! order! of! a! millimeter! or! larger! in breadth! can! be! treated! without! endangering! the! surrounding! tissue.! Larger! tumors,! typically! on! the! order! of several! square! centimeters! in! projected! area,! can! be treated! using! a! delivery! system! that! focuses! and! applies! the! radiation! to! a! wider! treatment! site,! preferably radiating! a! $0.8! \text{cm}^2$ area! of! the! treatment! site! or! larger. By! applying! the! radiation! over! a! larger! area,! for! example $500! \text{cm}^2$,! even! heating! of! large! tumors! can! be! achieved, reducing! the! chance! of! uneven! tumor! treatment! and! the risk! of! damaging! tissue.

The! present! invention! has! been! tested! in! animal! trials! and! is! effective! for! the! treatment! of! tumors.! FIGURE 3! illustrates! the! inhibition! of! melanoma! B16! growth! in mice! after! irradiation! in! accordance! with! this! invention. The! FIGURE! 3! chart! compares! tumor! volume! versus time! for! three! irradiation! levels! a! control! level! ($0! \text{J/cm}^2$); $90! \text{J/cm}^2$! and! $120! \text{J/cm}^2$! Irradiation! levels! of! $90! \text{J/cm}^2$ clearly! and! significantly! delay! tumor! growth,! and! an! irradiation! level! of! $120! \text{J/cm}^2$ causes! the! affected! tumor to! shrink! in! size.! Extrapolating! from! these! tests,! irradiation! levels! of! $200! \text{J/cm}^2$ are **believed! to! provide** therapeutic! results.! The! tumor! treatment! apparatus! in! these tests! applied! broad-band! radiation! in! the! band! from! 600 nm! to! 1000! nm! to! the! tumor.! No! apparent! tumor! response! was! observed! for! average! radiation! power! densities! below! $0.2! \text{W/cm}^2$.

Thus,! it! should! be! apparent! that! there! has! been! provided! in! accordance! with! the! present! invention! a! method and! apparatus! for! the! hyperthermic! treatment! of! tumors

that sully satisfies the objectives and advantages set forth above. Although the invention has been **described** in conjunction with specific embodiments thereof, It -is evident that many alternatives, modifications and variations will be apparent to those skilled in the art. Accord- 5
Ingly, it Is intended to embrace all such alternatives, modifications and variations that fall within the spirit and broad scope of the appended claims.

Claims

1. An apparatus for the hyperthermic treatment of tumors comprising: a radiation source (14) **adapted** to produce pulsed radiation output over a continuous band of wavelengths between 600 nm and 1000 nm at least in the visible and near-infrared at an intensity sufficient to cause tumor necrosis; and a delivery system proximal to the radiation source and adapted to direct the pulsed radiation output to a dermal treatment site. 20
2. An apparatus as claimed in claim 1, further comprising a filtering system adapted to restrict the pulsed radiation output to bands in the visible and near-Infrared range of wavelengths. 25
3. An apparatus as claimed in claims 1 or 2 wherein the delivery system is adapted to direct the pulsed radiation output to a beam having a cross-sectional area at a treatment site of at least 0.8cm². 30
4. An apparatus as claimed in claims 2 or 3 wherein the filtering system includes a filter adapted to block UV wavelengths. 35
5. An apparatus as claimed in any one of claims 1 to 4 wherein the delivery system is adapted to deliver the pulsed radiation output to the treatment area with a radiation density of greater than 0.2 W/cm². 40
6. An apparatus as claimed in any one of claims 1 to 5 wherein the delivery system is adapted to deliver the pulsed radiation output to the treatment site with a radiation density of greater than 90 J/cm². 45
7. An apparatus as claimed in any one of claims 1 to 5 wherein the delivery system is adapted to deliver pulsed radiation output to the treatment site with a radiation density of greater than 120 J/cm². 50
8. An apparatus as claimed in any one of claims 1 to 7 further including a processor adapted to control the pulse duration and pulse delay. 55
9. An apparatus as claimed in any one of claims 1 to 8 wherein the pulsed radiation source is adapted to provide a pulse delay of between 100 milliseconds

and 50 seconds.

10. The use of apparatus according to any one of claims 1 to 9 in a method of treatment of tumors.
